## What is The ADDRESS...?

*WHERE someone is living (TDK)...*

The PLACE where a data is located and the DATA that defines how it can be accessed...

*The address is a very important official reference information for urban management, which verbally explains the location of a place, ensuring that a certain place is reached in accordance with predetermined standards...*

- It is the basic identifier of any piece of land, whether urban, commercial, industrial, recreational or for whatever purpose.
- It is considered a more permanent and legal definition compared to other criteria such as property and right of use.
- In most public administration departments, the address is designated as the only criterion for the availability of various data sources

## Why is The ADDRESS important...?

25 Ekim 2020, Bir kargocu adresi bulamadığı için uğradığı saldırısı sonucu hastanede hayatını kaybetti. Kız arkadaşına iki ayakkabı sipariş eden şahıs, kargocu adresi bulamayıp teslimat gecikince, kargocuya telefonda randevuluşaşır, ürünleri teslim alırken, kargocuya ölübüresiye dövmüştü...

Son yıllarda adres bileşenleri belediyelere tabela olarak sahaya yansıtılmadığı için, ayrıca ciddi anlamda sokak adlarında seçimden seçime değişiklikler yapılabildiği için adres bilgisi istendiğinde yakınlardaki cami, market ya da büyük yapılar var ise bunları da adres ekleyerek adreslen çok, oraya ulaşım adımlarını da tarif eden adresler vardı. Mesela; 6841 SOK NO:26 EVKA-2 Çiğli İZMİR – Çiğli Emniyet Müdürlüğü'nden girilecek Kömürçü Otobüs Durağı'nın (ilk duraktır) yanındaki ara sokağa girilecek 26 NOLU EV. Çiğli (Prof. Dr. Ahmet Taner Kışlalı Mah.) İZMİR

Eş Durumu Atamalarında Adres Kayıt Sistemi Sorunu

Aile Birliği Mazereti Atamalarında Adres Kayıt Sistemi(AKS) Sorunu...

STREET NAMES? DOOR NUMBERS? ZIP CODE?

## Why is The ADDRESS important...?

**The address does what the coordinate information does, provides location information..**

Operatör (O): 112 Acil servis! Problem nedir?  
 Konuşmacı (K): Problem kocam! Sanırım kalp krizi geçiriyor.  
 O: Tamam bayan telaşlanmayın. Şu anda nereye gidiyor?  
 K: Evdeyiz..  
 O: Tamam da, bana evinizin adresini söyleyin!  
 K: "Hasan Ağanın Mahallesi" diyorlar buraya..  
 O: Nerede bu mahalle, Kent Merkezinde mi? Lütfen bana adresinizi söyleyin!  
 K: Aylin Market var ya, hemen üstü..  
 O: Hanımfendi lütfen adresinizi tam verir misiniz?  
 K: Yaa burası Çimenli..  
 O: Hanımfendi, bu söylediklerinize size nasıl ulaşalım?  
 K: Bak şimdi, sahil yolundan gelirken, Çimenli kasabını geç, ayırmadan sağa dön. Oralarda sor, sana nasıl geleceğini söyleyler. Ben camdayım zaten..  
 O: Lütfen ayrılmayın! (Bu arada ambulans olay yerine yönlendiriliyor..)  
 K: Artık gelmeyin. Sanırım kocam sizlere ömür..

8

## Benefits of ADDRESS information...?

**PUBLIC ASPECT**

- Finding a place,
- Transportation from one place to another,
- Distribution services,
- Emergency services,
- Fire services,
- Security services

**LOCAL GOVERNMENTS FROM THE POINT OF VIEW**

- Increasing tax revenues,
- Increasing municipal revenues,
- Increasing municipal services,
- Waste and garbage management,
- Increasing the effectiveness of urban planning and long-term programs,

**SPECIAL SECTOR FROM THE POINT OF VIEW**

- Management of infrastructure services,
- Control of water, electricity and communication networks,
- Maintenance and repair activities of the part of municipal services carried out by the private sector,

**A MORE LIVABLE CITY!!**

13

In some cases, a broad geographical assessment of the address is required. For example, if you want to use Land Management, Infrastructure Planning and Repair.

It is very important to accurately identify distribution points in a street or neighbourhood for mail distribution or planning of emergency services.

In a customer analysis, some distribution points may be excluded from the distribution network because of incorrect address data.

In the management of an emergency event, it may not be possible for the relevant unit (security, fire brigade, ambulance, etc.) to reach the scene quickly due to a lack of standard in the address data.

address data must be restored to a standard, both the address must be read correctly and written correctly.

**According to ISO/TC 211 address functions...**

- 1 Define address...** Local governments, Postal Operators
- 2 Identify address applications...** Electoral commissions, Infrastructure service providers, Local and central governments, Customer service
- 3 Find address...** Citizens Distribution services, Emergency services

## Address formats & standards used in the world...

**Address components by standards:** When the address formats and standards used in the world are examined, it is seen that the address data consists of a number of components. These components come together in different hierarchies from country to country to form address data. Examples include:

Category & No.	Standard	Sample Addresses	Component
(1) Address that identifies addressable entities or distribution points	ISO/TC 211 N 3188	Mr Girard, Flat B, Le Barcoleau, 1 allée 91940, LES ULIS	Building
(2) Address components that refer to a real-world entity	US FGDC Address	Statue of Liberty, Liberty Island, New York, NY	Road name
(3) Address components that refer to a geographic area	BS 7666	389 Chiswick High Road, London	Local
(4) Address components referencing a distribution area	US FGDC Address	PO Box 6943 Birmingham, AL 35305	ZIP code
(5) Address components that refer to a type of mail distribution service	AS 4590	PO Box 312 Paramatta BC NSW 2150	Mailing delivery ID
(6) Address components that refer to a distribution office	SANS 1883-1	477 Chopin Street, Glenstantia, 0010	Post office
(7) Address components that define proximity	INSPIRE	On the NW corner of Main and Cross Streets, Southampton	Identifying location

## Address formats & standards used in Europe...

**INSPIRE Data Specification on Address 2010-04-26**

- The 2007/2/EC INSPIRE Directive defines "address" data as a "positional data layer."
- According to this directive, the address is; with the help of path name, door number and postcode identifiers, it is shown as the most important locator.
- According to inspire address directive, address data is required to perform the following functions;
- 1- Locating (*distribution services, location and direction, etc.*)
- 2- Identification (*Immovable registration, etc.*)
- 3- Judgment / Notification (*Authorized person liability for property defined by address*)
- 4- Classification-sorting and ordering processes
- 5- Security and Emergency services

- TUCBS: JF Jeoloji/Çevre

\* TUCBS EK-II İkinci düzeydeki "Tematic" veri temaları, uygulamaya göre TUCBS-Koordinasyon Kurulu tarafından belirlenir...

It all happens somewhere...

If the nature of the places where events take place, their impact on humans, the environment and the benefits of this location can be better understood, better planning can be made, risks can be better managed and resources can be used more rationally. This approach increases the success rate of new startups, helps reduce potential future problems, and provides palpable financial benefits. Because of all this, "The place where everything happens" is important.

## TUCBS - SPATIAL DATA THEMES

### 1 TUCBS.AD Veri Teması

#### 1.1 Tanım

Adres teması, herhangi bir toprak parçası, binanın ve coğrafi varlığın konumu açısından tanımlanmasıdır. Adres; Mahalle/Köy, CSBM ve Kapı Numarası gibi bileşenler ile tanımlanmış olup konumsal olarak referanslandırılabilir. Ayrıca diğer coğrafi temalarda da ifade edilen ve gerçek dünya varlıklarını temsil eden Coğrafi Yer İsimleri konumsal olarak tanımlanmaktadır.

#### 1.2 Kapsam

Adres bilgisi kamuya yönelik birçok işlevde temel bilgi olarak yer almaktadır. Ulaşım güzergâhlarının belirlenmesi ve bunların coğrafi veriyle bütünsel kullanılması birçok çalışma disiplinine önemli faydalara sahiptir.

Yerel yönetimler tarafından **numarataj** çalışmaları kapsamında üretilen dış kapı, nokta geometride temsil edilmektedir.

Ulusal adres veri tabanında tanımlanan adres bilgisinin; idari birim, cadde/ sokak, bulvar/ mahalle (CSBM), kapı no ve posta kodu gibi anlamsal birlikte çalışabilirliği sağlayacak adres bileşenleri ile ifade edilmesi esas alınmaktadır. Ortak adres kodu kullanılarak adres bilgisi diğer TUCBS temalarındaki yol orta hattı, parsel ve bina gibi sınıflar ile konumsal olarak referanslandırılabilir. Gerçek dünya varlıklarını temsil eden Coğrafi Yer İsimleri, bu tema kapsamında tanımlanmış olup, idari birim, hidrografia ve ulaşım gibi temalardaki detayları temsil eden nitelikte konumlandırılabilir.

ÇEVRE VE ŞEHİRCİLİK BAKANLIĞI

## TUCBS - SPATIAL DATA THEMES

### 1 TUCBS.AD Veri Teması

TUCBS Projesi kapsamında yapılan Kurumsal Veri Gereksinim Analizleri sonucunda, Adres Veri Temasının aşağıda tanımlanan işlerde kullanıldığı ortaya çıkmıştır.

- ✓ Adres Konumsal Referanslandırma
- ✓ Kamu Yönetimiindeki Adres Tanımlamaları
- ✓ Mobil Atık Takip Sistemi
- ✓ Yapı Denetim
- ✓ Kadastro
- ✓ Plan Hazırlama
- ✓ Mekânsal Adres Kayıt Sistemi (MAKS)
- ✓ Çevrimiçi Emlak Ve İnşaat İzinleri
- ✓ Taşınmaz Envanter Sistemleri
- ✓ Hizmet Alanı Sınırları Belirleme
- ✓ Kamulaştırma
- ✓ Araç Takip Sistemleri
- ✓ Acil Durum Yönetimi
- ✓ Okul Kayıt Sistemleri
- ✓ Vergi Tabanlı Uygulamalar
- ✓ MERNİS
- ✓ Yargı Sistemleri – Tebligat – İhbarname
- ✓ Aile hekimliği / Sağlık uygulamaları

## What is NUMARATAJ...?

*The numarataj certificate is to determine the address of the squares, boulevards, streets, roads, streets and structures that have a faced within the boundaries of the municipal area and to ensure that any building or similar object is defined in terms of geographical location and function.*

### ADRES VE NUMARALAMAYA İLİŞKİN YÖNETMELİK

Resmi Gazete Tarihi : 31 Temmuz 2006 - Resmi Gazete Sayısı: 26245

Amaç : Madde 1 - (1) Bu Yönetmeliğin amacı, binaların numaralandırılması, numaralandırılan binalara ait adreslerin Ulusal Adres Veri Tabanına işlenmesine ilişkin usul ve esasları belirlemektir.

Madde 4 - (1) Bu Yönetmeliğin uygulanmasında;

- Adres: Herhangi bir toprak parçası veya binanın coğrafi konumu ve işlevi açısından tanımlanmasını,
- Adres bileşenleri: Numaralama işlemlerinde kullanılan unsurlar; posta kodları, il, ilçe, bucak, köy ve mezra isimleri, mahalle, meydan, bulvar, cadde, sokak isimleri ile sabit tanıtım numarası ve bina numarası gibi adres verileri ile tanımlanan coğrafi konum, kişisel ve kurumsal adres bilgisine ulaşmak için gerekli olan bilgileri,

## What is NUMARATAJ...?

- With the Address Registration System (AKS) created on the basis of the Population Services Law No. 5490, it is aimed to keep the settlement and other address information of Turkish Citizens and foreigners with a residence permit in Turkey for at least six months up to date in a central structure electronically and to end the clutter about the address.
- In this context, national address database (UAVT) was established by municipalities and provincial special administrations by completing numbering and slabbing works throughout the country. The data obtained by the Turkish Statistical Institute (TÜRKSTAT) as a result of the field application to match the identity numbers of the People of the Republic of Turkey with the address information has been transferred to the General Directorate of Population and Citizenship Affairs and has started to be kept up to date electronically.
- UAVT, which is an important prerequisite for keeping people's locations and other addresses up to date, is designed text-based in the current structure. Within the framework of the principles and procedures determined by the Population Services Law No. 5490 and the Regulation on Address and Numbering, authorized administrations (municipalities, provincial private administrations and organized industrial regional directorates) process the changes in address components within their areas of responsibility to UAVT and in this way, the data kept up-to-date are shared with public institutions and organizations through the Identity Sharing System.

29

## UAVT – National Address Database Problem...?

**Ulusal Adres Kayıt Sistemi UAVT → MAKS**

✓ UAVT (National Address Database) was created. However, the data was kept only textual and the location could not be compatible. With the data on the site, there were 30% erroneous situations between the records by province.

31

## MAKS – Spatial Address Registration System...?

**HEDEFLER...**

- Creating a more effective and functional Spatial National Address Database by adding a spatial dimension to the National Address Database (UAVT), on which all address components throughout the country are managed textually,
- Preparation of services that will allow authorized administrations with Geographic Information System (GIS)based Urban Information Systems (KBS) to keep spatial UAVT up to date with the integration of systems without the need for a second manual data entry,
- Spatial data sharing and the creation of data update infrastructure to ensure the continuous up-to-dateness of this shared data, which will ensure that the address data needed by many institutions and organizations is provided more effectively and accurately in accordance with the existing standards through Spatial UAVT,
- To create the infrastructure that will allow the building documents issued by the competent administrations within AKS to be integrated with the systems of the relevant institutions involved in the Spatial UAVT and building documents process, to be organized more effectively, quickly, efficiently and accurately, to automatically update Spatial UAVT in the process and to integrate it with authorized management systems,
- The creation of an infrastructure where citizens can access the processes related to address components and building documents more quickly and accurately and ensure transparency in address-based services.

32

## MAKS – Spatial Address Registration System

**YÖNTEM...**

- Within the scope of MAKS Project, it is aimed to create a multilayered centralized system and software architecture. System architecture; it will have a multilayer architecture consisting of at least one textual database layer, at least one spatial database layer, application layer, and client layers.
- The system to be created; Depending on the structure, competence and size of the competent administrations, it is aimed to operate in the following three different scenarios:
- Ensuring the reciprocal processing of spatial data changes, both within their own bodies and carried out within NVİ, by integrating the systems of the authorized administrations with CBS-based KBS with the services to be offered from the center,
- Ensuring the reciprocal processing of spatial data changes that occur within their own bodies and carried out within NVİ by integrating the systems of the authorized administrations with the services to be provided through the servers that are directly connected to the central system and will be placed on the local networks of the authorized administrations,
- Ensuring that authorized administrations that do not have GIS-based KBS, which it carries out actively and effectively, but have data in accordance with the data standard to be created within the scope of this project, can carry out their transactions with web interfaces to be created in the center.

## MAKS – Spatial Address Registration System

With MAKS, the map of Turkey is opened; The county list, data quantity, and proportions table is listed by a default component. In addition, a graph determined according to provincial-authorized administration-mah/village levels is shown.

When a province is selected through the table, that province is approached on the map. The table lists the competent authorities in the province. When one of the authorized administrations is selected from the table, the authorized administration is approached on the map. The table lists the neighborhood/village within the authorized administration. Independent, building, number and road component ratios will be shown at the provincial and competent administration level and at the Neighborhood/village level.

## MAKS – Spatial Address Registration System

Across the country, a unique address identification system, just like TC.NO, will be introduced in the AD.NO (ADDRESS-NO).

Thus, all address information services in the country will use ADDRESS-CODE instead of complex and time-consuming address location definitions.

**EXAMPLE:**  
AD.NO = 39.32.5725.4724  
Latitude: 39,5725  
Longitude: 32,4724

**GEO-CODE Application**

38

## GEOCODING – Addressing by geographic coordinate...?

- Geocoding is the process of converting a location (information such as coordinates, addresses and names) to a marked location on the geography of the world.
- It can also geocode with only one of the location-related variables, or it can also use multiple table-diced variables for a healthier conversion.
- With geocoding, it is possible to access a lot of information about a location; it has a wide range of applications, from thefts in a particular region to all kinds of positional socio-economic analyses of customer locations.
